

Testing Ethereum

How the Ethereum Foundation uses tools like Kurtosis
for **testing protocol upgrades**

The Merge

My Goal

- Blockchain testing != easy
- How EF does it
- Kurtosis?
- You<>Blockchain dev/testing<>Kurtosis?

**How do you spin up Ethereum
on your computer?**

Traditional long process

Local Ethereum loading...

- Generate data to configure blockchain
 - Configure Genesis
 - Which fork? (forks)
- Spin up Ethereum nodes
 - EL + CL client software
 - Lodestar, nimbus, geth, besu, prysm, netheremind
 - Setup with (identical) genesis data
 - Validator keys and

40%

- secrets
 - Get them to talk to each other (network configuration)
 - Additional tools
 - Explorer, wallet, tx spammer?
 - Monitoring?

Existing tools

Local Ethereum loading...

docker

```
#!/bin/bash
```

```
~root: env X="() { ;; } echo shellshock" /bin/sh -c "echo completed"
```

```
> shellshock  
> completed
```

or

or

do the same thing

or
do the same thing
in **1** line

```
$ brew install kurtosis-tech/tap/kurtosis-cli
```

```
$ kurtosis run github.com/kurtosis-tech/ethereum-package
```

```
$ brew install kurtosis-tech/tap/kurtosis-cli
```

```
$ kurtosis run github.com/kurtosis-tech/ethereum-package
```

 K U R T O S I S

Remember where we started?

Local Ethereum loading...

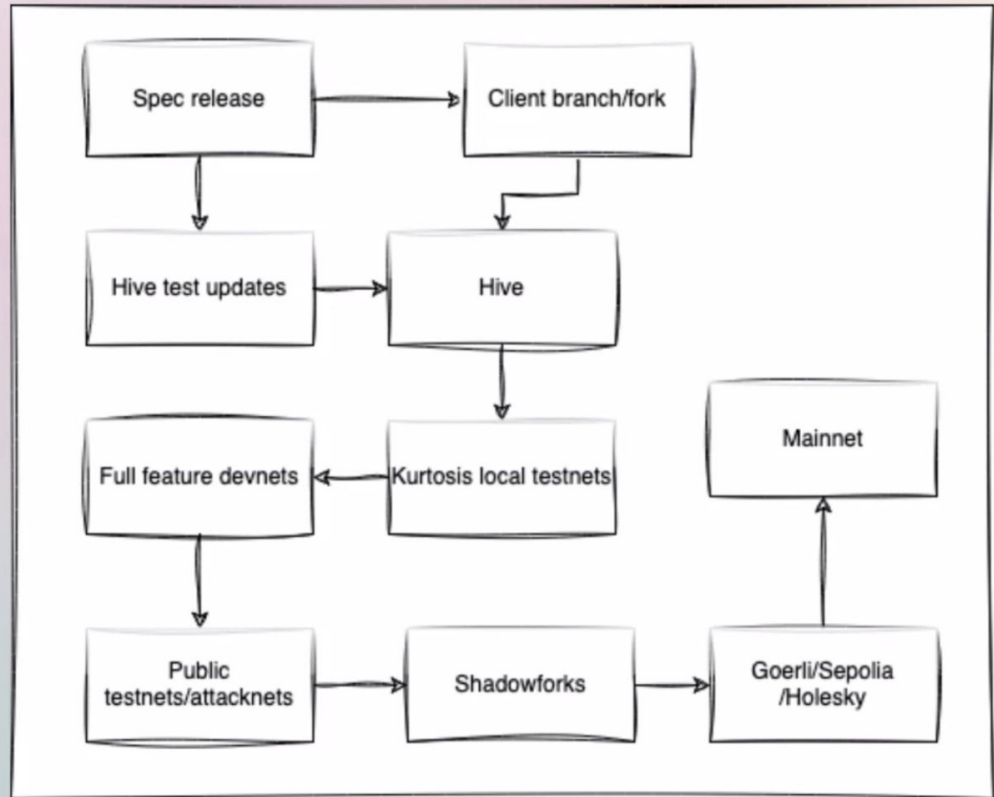

- Generate data to configure blockchain
 - Configure Genesis
 - Which fork? (forks)
- Spin up Ethereum nodes
 - EL + CL client software
 - Lodestar, nimbus, geth, besu, prysm, netheremind
 - Setup with (identical) genesis data

40%

- Validator keys and secrets
 - Get them to talk to each other (network configuration)
 - Additional tools
 - Explorer, wallet, tx spammer?
 - Monitoring?

EF <> Kurtosis

EF <> Testing

Dencun Testing

Barnabas Busa

What is Kurtosis, and why do we care?

- Very fast iteration, spin up a local devnet under 5 mins
- Local testing
- Custom testnet, 3 second slot time, quick fork test
- Scalable - kubernetes scale
- Non persistent - does not require large SSDs
- All clients are now supported
- Simple configuration, no background knowledge needed

Some other Notes

- EF == decentralized == ↑coordination
- Multiple DevOps / testing teams
- Variety of tests
 - Spec
 - Regression
 - Scale
 - Chaos
 - Fuzzing

Demo: Running an MEV Ethereum Test

```
$ git clone git@github.com:kurtosis-tech/protocolberg.git
```

```
$ go test -v -timeout=20m ./
```

In the Wild....

dencun-devnet-8 specs

🚧 4844 requires a trusted setup file, Please ensure that there is a way for us to specify the file through a runtime flag such as `--trusted-setup-file` (or similar). If the file is baked in during compile, please ensure that the flag would indeed override the file. This is a **MUST** requirement for devnet 8. If your client does not support the override, we can't include it in the devnet.

🚧 The specs listed here is currently for hive and only once hive is green we will move on to client deployment on devnet-9.
Until we have enough clients green, 4844-devnet-8 is the canonical chain.

EIP List for Dencun

EIP-1153: Transient storage opcodes
EIP-4844: Shard Blob Transactions
EIP-4788: Beacon block root in the EVM
EIP-5656: MCOPY - Memory copying instruction
EIP-6780: SELFDESTRUCT only in same transaction

In the Wild....

wait

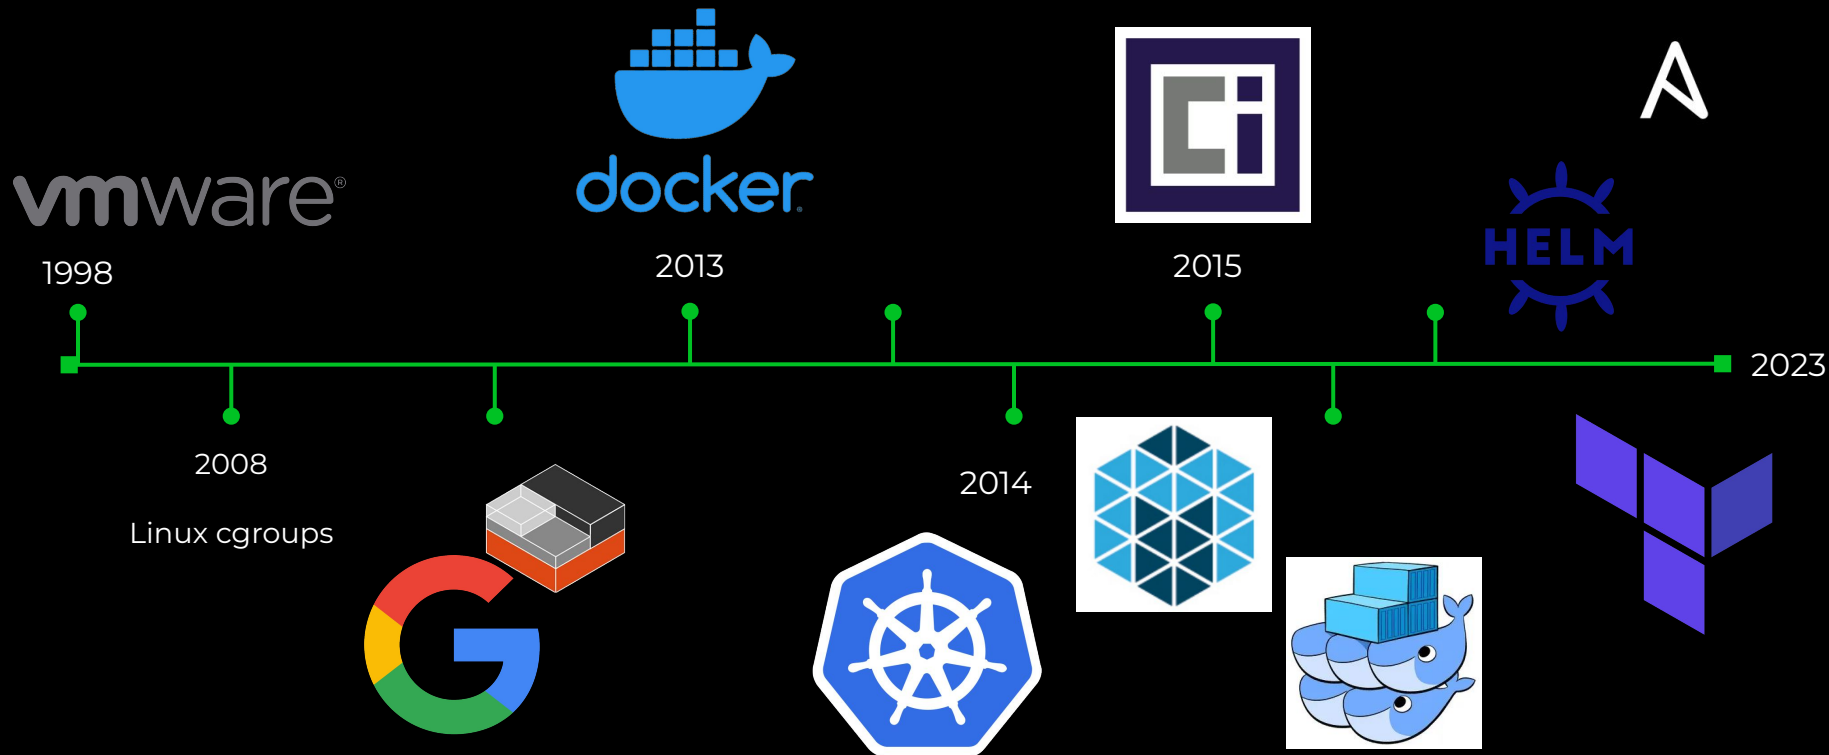

wait

so what is Kurtosis?

**Make building distributed systems
as easy as building single server apps**

 MISSION

Brief History of Containerization

 KURTOSIS

The Future

How? One tool for entire SDLC

You <> Ethereum <> Kurtosis

1 Find something to work on (EIP's, Bug Bashing, Your Next Research Project)

2 Write a Kurtosis Starlark Package

3 Let us know about it!

The End. Thank you! Questions?
